Application Serial No. 10/540,892 Reply to office action of November 9, 2009

PATENT Docket: CU-4288

Amendments To The Claims

The listing of claims presented below will replace all prior versions and listings of claims in the application.

Listing of claims:

- (currently amended) An apparatus for transmitting data in a digital broadcasting system, comprising:
- a source encoding unit for encoding data to be transmitted and generating source-coded data;
- a capacity managing unit for dividing the source-coded data into divided data for a plurality of channels, and generating header information <u>for reconstruction of corresponding to</u> the divided data:
- a channel encoding unit for encoding each of the divided data according to each of channel environment and generating channel-coded data for transmitting the channel-coded data through multiple frequency bands; and
- a transmitting unit for multiplexing, modulating and transmitting the channel-coded data.
- 2. (previously presented) The apparatus as recited in claim 1, wherein the capacity managing unit stores information of available capacity and unavailable capacity for each frequency band, divides the source-coded data in case that an available data capacity for transmitting the source-coded data does not exist in one channel but sum of the available data capacities of multiple channels can accommodate the source-coded data, and adds the header information in a data packet so as to reconstruct the data in the

Application Serial No. 10/540,892 Reply to office action of November 9, 2009 receiving apparatus.

PATENT Docket: CU-4288

- 3. (withdrawn) An apparatus for receiving data in a digital broadcasting system, comprising:
- a tuning means for receiving transmitted data through multiple frequency bands and multiple broadcasting sites;
- a demodulating means for demodulating the received data and generating demodulated data;
- a de-multiplexing means for de-multiplexing the demodulated data and generating de-multiplexed data;
- a decoding means for decoding the de-multiplexed data and generating decoded data; and
 - a data combining means for combining the decoded data.
- 4. (withdrawn) The apparatus as recited in claim 3, wherein the combining means combines the data based on header information that is included in the decoded data.
- 5. (currently amended) A method for transmitting data in a digital broadcasting system, comprising:
- (a) encoding image data and audio data to be transmitted and generating sourcecoded data;
- (b) dividing the source-coded data into divided data for a plurality of channels, and generating header information for reconstruction of corresponding to the

divided data;

- (c) channel encoding each of the divided data according to each of channel environments and generating channel-coded data for transmitting the channel-coded data through multiple frequency bands; and
 - (d) multiplexing, modulating and transmitting the channel-coded data.
- 6. (previously presented) The method as recited in claim 5, wherein the dividing the source-coded data includes storing information of available capacity and unavailable capacity for each frequency bands, and dividing the source-coded data in case that an available data capacity for transmitting the source-coded data does not exist in one channel but sum of available data capacities of the multiple channels can accommodate the source-coded data, wherein the header information is used to reconstruct the data in the receiving apparatus.
- 7. (withdrawn) A method for receiving data in a digital broadcasting system, comprising the steps of:
- (a) receiving transmitted data through multiple frequency bands and multiple broadcasting sites;
- (b) demodulating the received data for each frequency band and generating demodulated data;
- (c) de-multiplexing the demodulated data for each frequency bands and generating de-multiplexed data;
 - (d) decoding the de-multiplexed data for each frequency bands and generating

decoded data; and

- (e) at combining means, combining the decoded data.
- 8. (withdrawn) The method as recited in claim 7, wherein the combining means combines the data based on header information that is included in the decoded data.
